## A1 Overview

This appendix presents the main empirical results for “The Global Diffusion of Policies and Institutions.” It includes both the reported and some unreported findings. It is to be posted online upon publication of the article. It is organized as follows:

- Data description: coding of environmental ministries and environmental aid.
- Association between environmental ministry formation and policy: to establish the relevance of environmental ministries for actual policy.
- Robustness overview: detailed discussion of robustness tests reported in the main text.
- Figures for empirical analysis.
- Tables for empirical analysis: model without interactions, various codings of democratization, various codings of environmental aid, remaining robustness checks.

## A2 Data Description

### A2.1 Environmental Ministries

We constructed our panel dataset for national environmental ministries, as defined in the main text, in the fashion described below. If this article is accepted for publication, we will publish a complete list with a description of data sources.

First, we obtained a partial dataset from Busch and Jörgens (2005*b*). From this dataset, we were able to recover adoption information for 106 national environmental ministries by the year 2000. We verified independently that their codings did not contain errors, and we found their data reliable.

Second, we began collecting information for the remaining countries. We were able to find reliable information on the establishment of a national environmental ministry for another 35 countries that were not included in the previous dataset. While many of these national environmental ministries were established after 2000, we found 18 that were established before that. Thus, we were able to significantly improve the Busch and Jörgens (2005*b*).

For 16 countries, we were able to find current (as of April 2010) information indicating that they do not have an environmental ministry. As such information, we admitted official information on the structure of the government – such as national administrative websites or documents – or secondary information from respectable sources, such as major national newspapers.

For the remaining countries, we were either unable to find information on a national environmental ministry or found confirmation that they have a ministry, but the exact year of establishment was unclear. In the first case, we followed the conservative coding of Busch and Jörgens (2005*b*) and coded countries as not having an national environmental ministry. This coding is theoretically appropriate, because total absence of information indicates that at the very least, a national environmental ministry is inactive (more probable, does not exist). In the second case, we used two different codings. On the one hand, in the main text we coded such countries conservatively as not having an environmental ministry. Since many such countries have experienced major political changes, including democratization, this coding decision stacks the deck against our theoretical argument. On the other hand, we also estimated our statistical models excluding all such countries. Thus, we were able to verify that our results do not depend on a subjective coding decision.

To ensure coding reliability, we coded the national environmental ministries independently. Each case was first coded by one individual and then verified by another individual. In approximately 95 per cent of

the cases, the individual codings were in agreement. For all of the remaining cases, we conducted a case study to find out when the national environmental ministry was actually established. In almost every such instance, the coding discrepancy resulted from the fact that one of the coders had not found information on early adoption. In total, there were only a handful of cases that required a more careful consideration of the adoption year.

Finally, for every case, we tried to find information indicating that the national environmental ministry had been dismantled at some subsequent time. We were not able to find such information for any country. For some cases, such as Iraq since 2003, we found information indicating that national environmental ministries had been in a state of disarray temporarily. However, there were no cases with evidence indicating that they had been permanently dismantled.

## A2.2 Environmental Aid

The environmental aid data is derived from the AidData project (Hicks et al., 2008). We defined environmental aid based on the OECD coding. The codes for the narrow definition of environmental aid include all projects listed under the following Creditor Reporting System (CRS) purpose codes: 41010, 41020, 41030, 41040, 41050, 41081, 41082.

The broad definition includes in addition the CRS codes 32210, 43030, 43040, 60061. See the OECD website at [http://www.oecd.org/document/0/0,2340,en\\_2649\\_34447\\_37679488\\_1\\_1\\_1\\_1,00.html](http://www.oecd.org/document/0/0,2340,en_2649_34447_37679488_1_1_1_1,00.html) for additional information. Accessed April 20, 2010.

### A3 Associations Between Ministry and Policy Formation

We examined the relationship between the establishment of an environmental ministry and policy formation in three ways. First, we examined graphically the correlation between ministry and policy formation. Busch and Jörgens (2005a, 88) provide data for over 100 countries and over the years 1967-2000. While their dataset is not complete, and thus inappropriate for our empirical analysis, in this relatively large sample the association between ministry formation and other environmental laws is very strong. In particular, the diffusion of environmental ministries follows a curve that is almost identical to environmental framework laws. The positive association with environmental impact assessment laws is also very strong, and by the year 2000 the set of countries with a ministry is almost identical to the set with environmental impact assessment laws.

Next, we used ratification data from Bernauer et al. (2010) for 255 global environmental treaties, 1945-2000. We computed the number of treaties that each country had ratified by each year, and compared the average number for all countries with and without a ministry in that year. We report the results for 1980, 1990, and 2000 here:

- In 1980, the means were 40.2 (ministry) and 19.8 (no ministry);
- In 1990, the means were 49.4 (ministry) and 29.2 (no ministry);
- In 2000, the means were 60.3 (ministry) and 40.7 (no ministry).

Thus, the difference remains at approximately twenty throughout the time period. These observations are strongly supportive of our contention that ministry formation is associated with increased engagement in global environmental governance.

Finally, we used ENVIOPOLCON data from Holzinger, Knill, and Sommerer (2008). We compared the number of policy instruments in industrialized and post-communist countries as a function of environmental ministry in 1980, 1990, and 2000. In 1980, we did not find a noticeable difference: the means were 5.4 each. In 1990, countries with a ministry had reached a level of 8.9 while countries without a ministry had reached a level of 8.6. By 2000, this difference in favor of ministry countries had grown to 16.5 versus 13. While ministry formation was not initially associated with a higher propensity for policy formation, by the year 2000 the difference was very clear.

## A4 Interpreting Interactive Regression Models

Interpreting interactive regression models – both in a linear and a non-linear setting – is not straightforward (Brambor, Clark, and Golder, 2006). Suppose the estimated model is:

$$y = \hat{a} \cdot X + \hat{b} \cdot Z + \hat{c} \cdot X \cdot Z. \quad (1)$$

Then, the marginal effect with respect to  $X$  is:

$$\frac{\partial y}{\partial X} = \hat{a} + \hat{c} \cdot Z. \quad (2)$$

The standard errors of these marginal effects can be computed as follows (Brambor, Clark, and Golder, 2006). Using again the marginal effect of  $X$  as an example, we find:

$$\text{Var}(\text{marginal effect}) = \text{Var}(\hat{a}) + Z^2 \cdot \text{Var}(\hat{c}) + 2 \cdot Z \cdot \text{Cov}(\hat{a}, \hat{c}). \quad (3)$$

## A5 Robustness Overview

We subjected our results on the domestic, international, and interactive variables to a series of robustness tests. The first series of tests regard the democratization variable. We replicated our analysis using various coding schemes. First, we changed the time window of the variable. The democratization variable used above measured the difference in democratic institutions between  $t$  and  $t - 3$ . Using both  $t - (t - 1)$  and  $t - (t - 5)$ , we found no meaningful difference. In fact, the results tended to be stronger – both in terms of significance levels and substantive effects – in both cases, especially in our analysis of environmental aid.

Second, we varied the threshold of change in political institutions in order to be defined as democratizing. That is, we earlier requested that the difference in Polity IV score be greater than, or equal to, 3 for a country to be considered democratizing. We examined whether this holds when the threshold is moved to 2 and to 4. Again, in both cases the results were remarkably similar in terms of substantive effects or significance levels, with a tendency to be stronger (again, mainly in our estimations of the effect of environmental aid).

Third, we estimated the models presented in this paper replacing the democratization variable by the difference (over three years) of the Polity IV score. This has the disadvantage of considering a country to be democratizing even if it improves its Polity IV score by one single unit over three years. However, it has the advantage of being more nuanced. In any case, our results generally hold for all models, although the interaction effects in Table A8 often lose significance levels.

Fourth, we used the recent dataset by Cheibub, Gandhi, and Vreeland (2010) on democracies to evaluate whether our findings were vulnerable to alternate democratization measurement. Their democracy variable is a dichotomous measure that requires the fulfillment of a number of conditions, such as the presence of elections at the legislative and executive level, and the legal existence of competitive political parties. We transform this variable by taking the first difference, which accounts for a democratization process. In fact, we generally find that the results either hold or are actually even stronger. For instance, we are able to replicate the results of Table 3 (from the article), except that now democratization is also significant (Table A33). With regard to the broad definition of environmental aid, we find that all three variables of interest have a significant and positive impact on the creation of ministries. Environmental aid defined more narrowly yields results that are less clear: while the domestic and international variable remain significant, the interaction disappears. Finally, our results hold for regional and global peer pressure, although the

significance levels fluctuate. Results for the Freedom House democracy measure are similar, with everything being robust except for the interaction in the narrow definition of environmental aid.

Another set of robustness checks pertains to the environmental aid variable. As we mention above, the median value for environmental aid is 0. To establish whether our results hold when aid recipients outliers are eliminated, we replicated Tables 4 (from the article) using only observations below the 90th percentile of environmental aid values (see Table A48 and following). Again, we globally find similar results than reported in this paper. The second test we performed on environmental aid is use other moving averages. The results reported above measure environmental aid as the average aid received between  $t - 1$  and  $t + 1$ . The rationale is that the accounting of support to capacity building can precede or follow the creation of an environmental ministry. In the appendix, we report the results if we use a purely backward looking perspective: we use the average from  $t - 4$  to  $t - 1$ . The results remain globally the same, especially when considering the broader definition of environmental aid. Finally, we also use the initial aid variable but lag it by one period (as well as the two other main independent variable, democratization and the interaction effect). Here again, the results generally hold.

We also added interactions between democratization and income per capita to account for the possibility that democratization's effect on ministry formation depends not only on international pressure but also on wealth levels. We found that this interaction has weak and inconsistent effects. More importantly, controlling for it does not compromise for any of our main results.

Next, we reanalyzed the models dropping OECD countries. The effects found in this paper might arguably be driven by wealthy and industrialized countries. We find that our generally results are robust to the removal of OECD countries. In fact, the results tend to be even more supportive of our theoretical expectations. This is the case in particular of the equivalent of Table 3 (from the article), where international pressure is captured in the post-Rio period. Furthermore, we find that environmental aid becomes a significant predictor of environmental ministries in the equivalent of Table 4 (from the article), although democratization tends to lose significance levels. The only adverse finding is that the results become cloudy for the replications of Table 5 (from the article). This may be explained by the strong signaling effect that OECD countries have. Removing them might indicate that peer pressure is not equally divided across countries.

We also added a dummy variable that identifies countries in the post-communism transition. This vari-

able takes a value of 1 in the years after the end of the communist regime in relevant countries. This mainly concerns Central and Eastern Europe, but also the post-Soviet republics in Central Asia. Adding this variable tends to strengthen our results. The point estimates are generally higher and statistically more significant, and not surprisingly, the post-communism country-year dummy is positive and significant.

As discussed above, our final robustness check was to include the different proxies of international pressure under a unified model. Specifically, we interacted our democratization measure with each of the three main pressure measures: the Rio years dummy, environmental aid inflows, and peer pressure. The results continue to hold, testifying to the validity of each proxy for international pressure.

## **A6 Figures**

This section contains all figures for the empirical analysis.

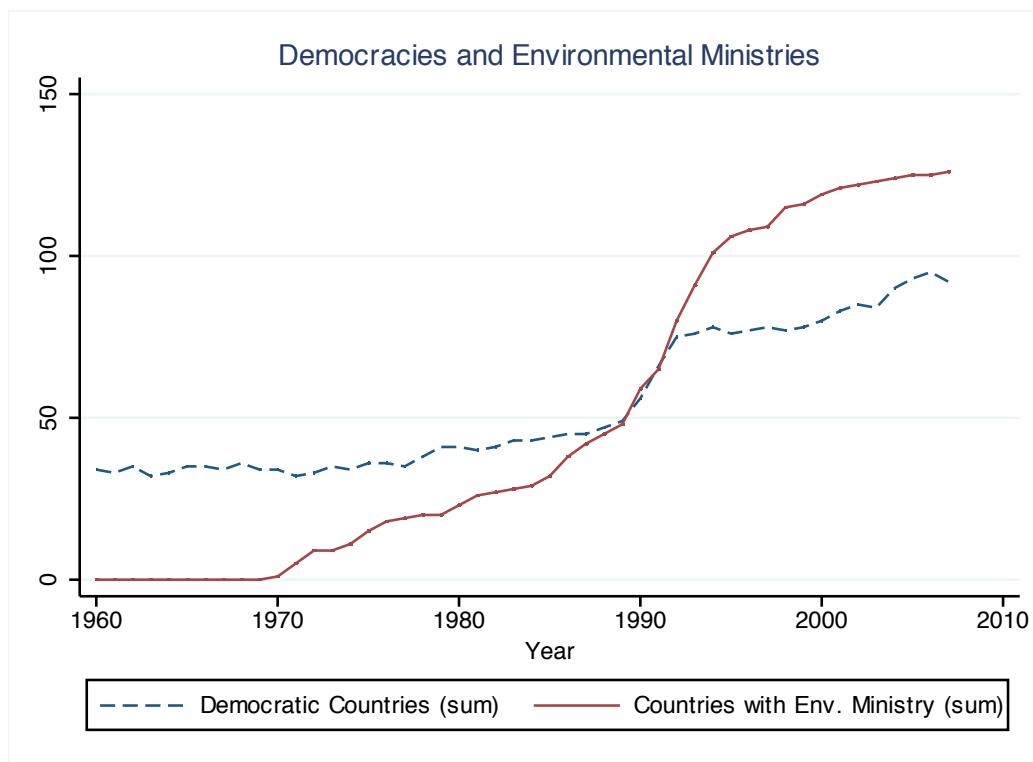

Figure A1: Democracies and environmental ministries.

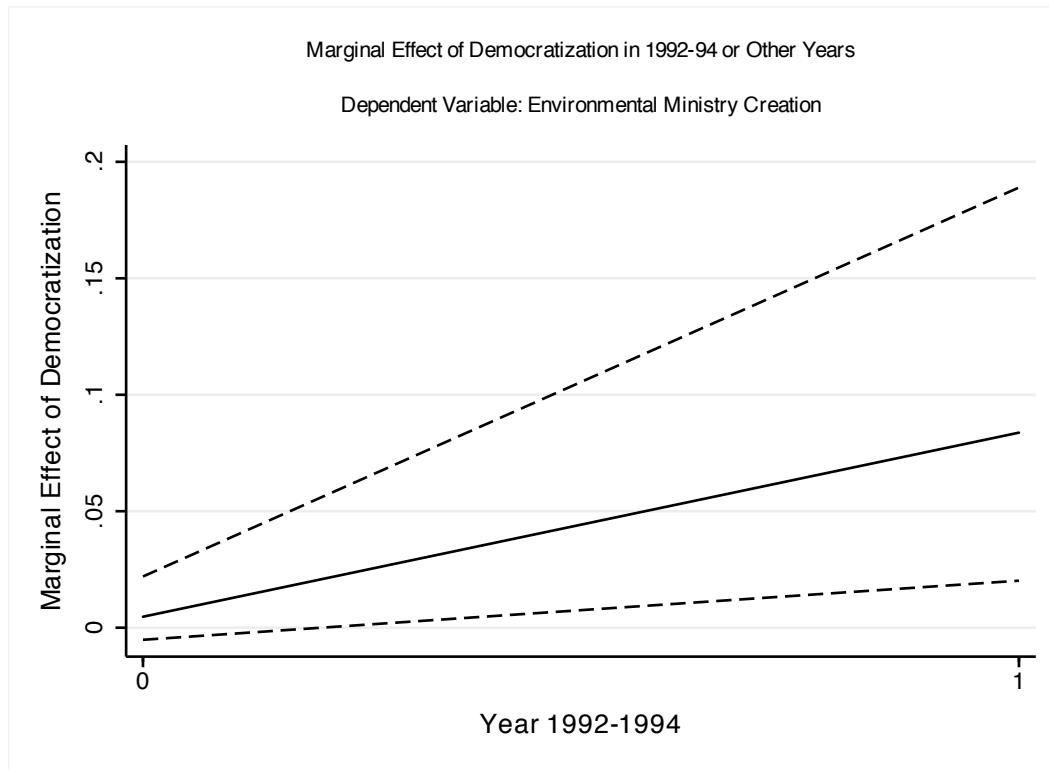

Figure A2: Marginal effect: international pressure.

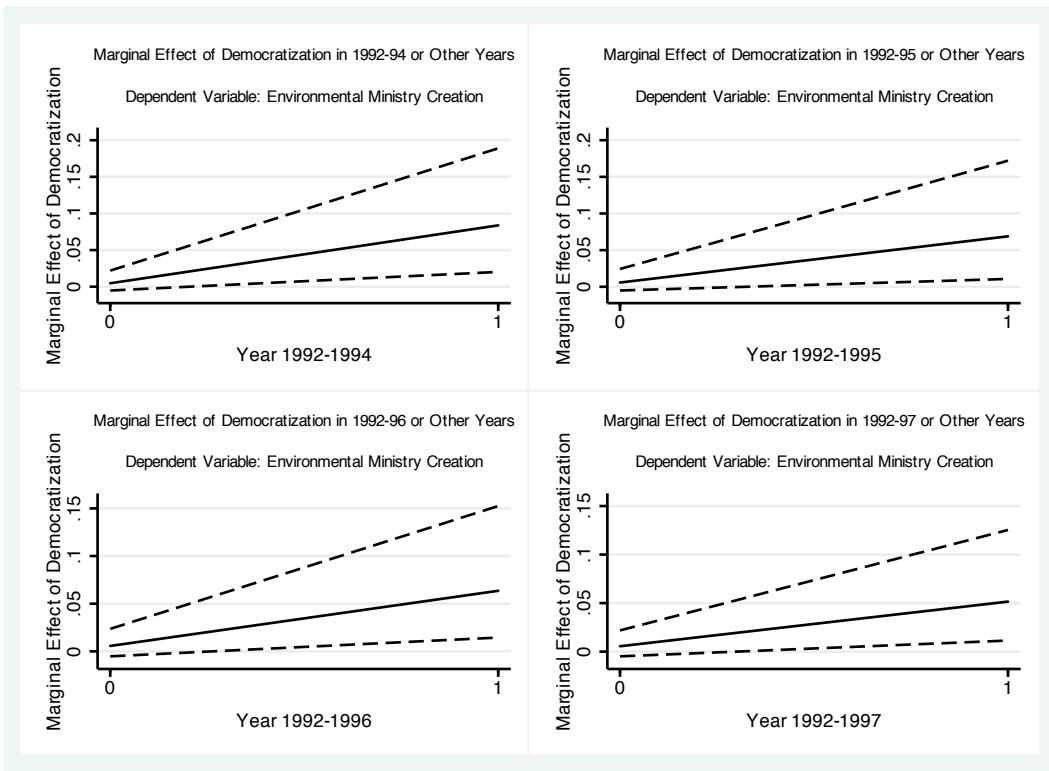

Figure A3: Marginal effect: international pressure (various years).

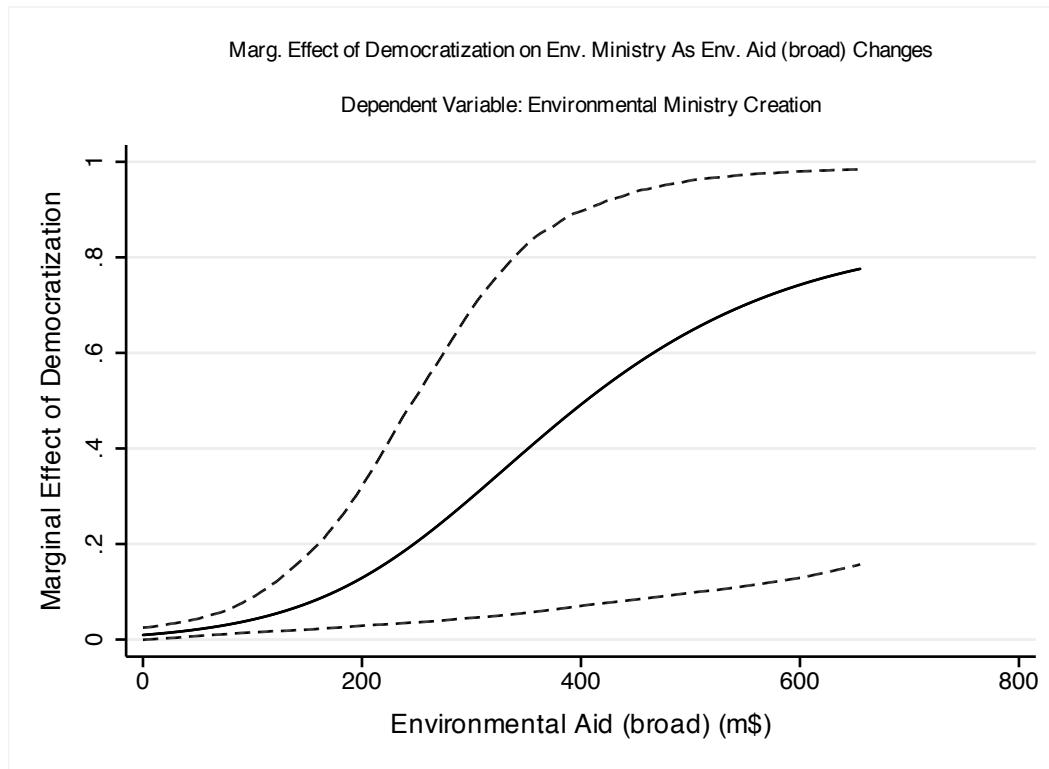

Figure A4: Marginal effect: environmental aid (broad).

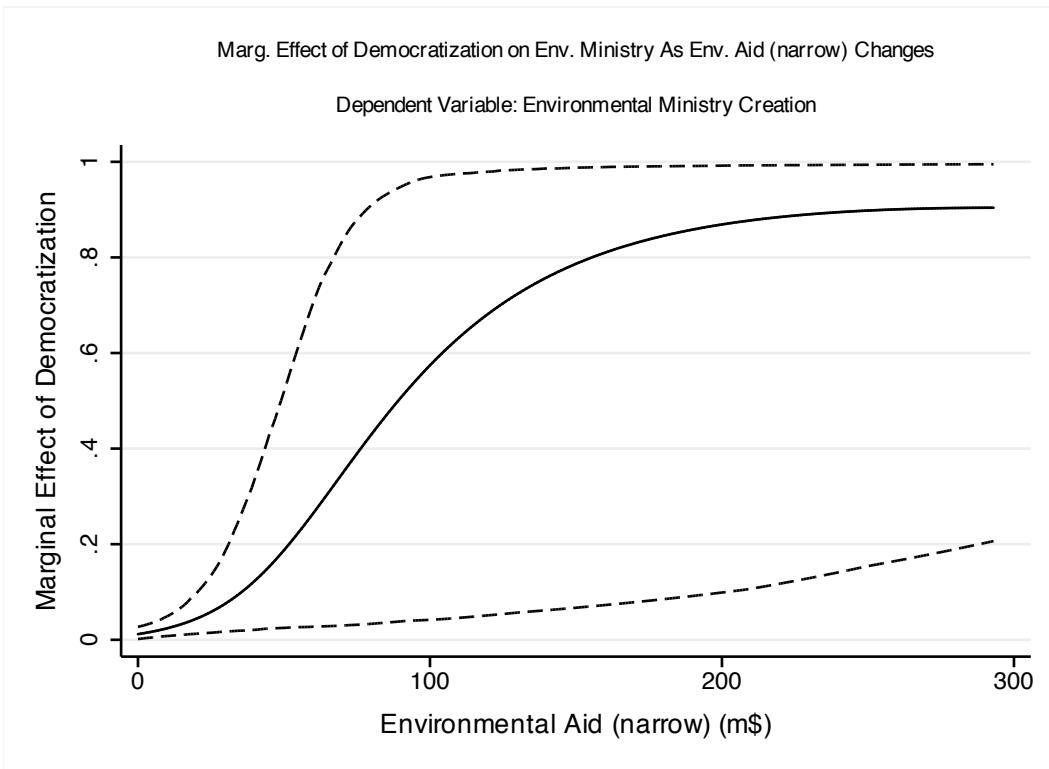

Figure A5: Marginal effect: environmental aid (narrow).

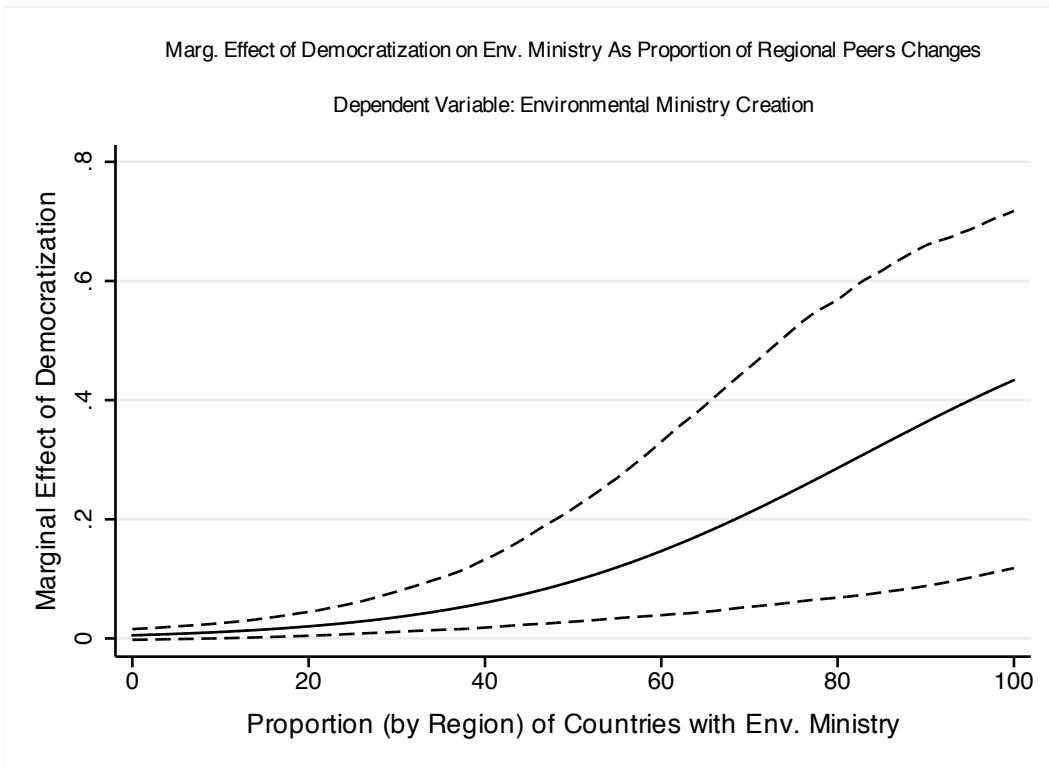

Figure A6: Marginal effect: regional peer pressure.

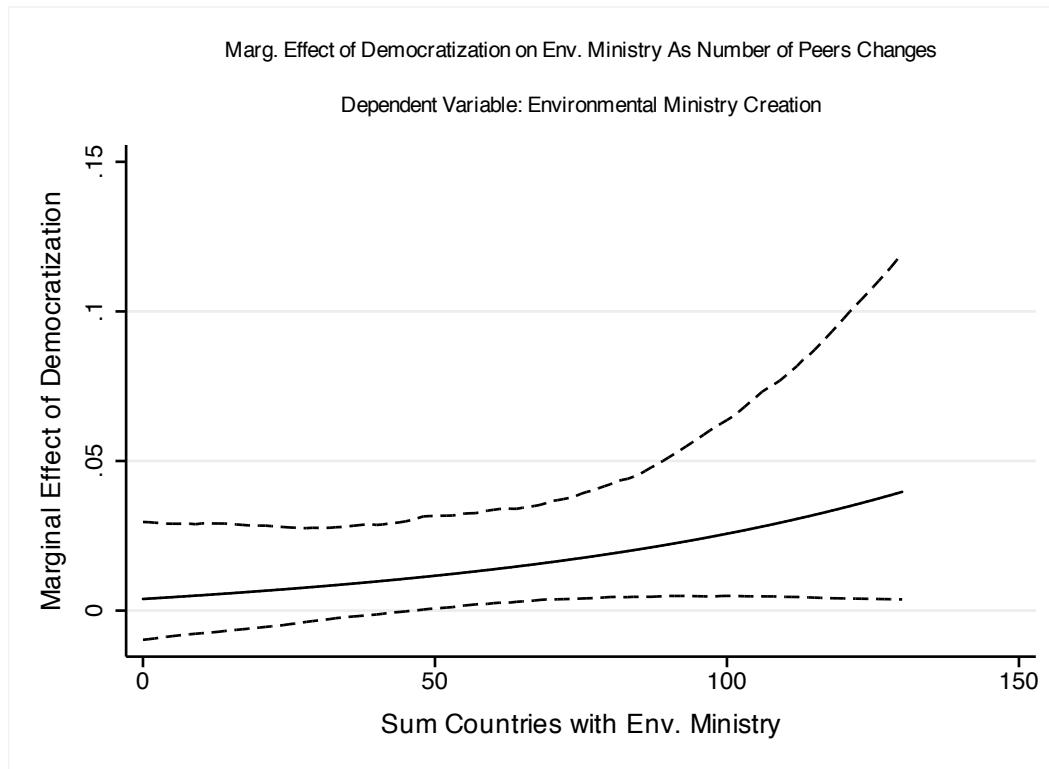

Figure A7: Marginal effect: global peer pressure.

## A7 Tables

This section contains all tables for the empirical analysis. The first subsection presents the estimates for the table without interactive effects referred to in the main paper, additional statistical specifications of our main models, and an expanded correlation matrix that includes all interactions.

The next subsections present the results for all the robustness checks mentioned in the paper, starting with modifications of the democratization variable, followed by alternate environmental aid specification, and concluded with other robustness tests. In each table, we present the raw coefficients. For example, the marginal effect of environmental aid would therefore be  $\beta_{aid}$  without democratization and  $\beta_{aid} + \beta_{aid*demo} * DEMO$ . In almost every model of every table, this addition results in a larger combined coefficient, thus indicating that the tables support our empirical hypotheses. Notice that all Weibull models are missing when estimating the models that control for the ‘green’ civil society; the reason is that data limitations prevent these models from converging.

## A7.8 Environmental Ministries and Environmental Outcomes

In this section, we present the estimates of (country) fixed effects models that show that the creation of an environmental ministry is associated with a drop in per-capita carbon dioxide and sulfur oxide emissions.

**Table A89: Environmental Ministries and Carbon Dioxide**

	FE	FE	FE	FE+Year FE
Environmental Ministry	-1.000*** (0.102)	-0.185* (0.102)	-0.225*** (0.081)	-0.191** (0.082)
Year	0.063*** (0.003)	0.048*** (0.003)	0.057*** (0.003)	
GDP per capita (K\$)		-0.060*** (0.009)	-0.069*** (0.008)	-0.068*** (0.008)
